1. Introduction

1.1. How to use this manual

This User Manual is divided into five sections which covers the Introduction, Overview, Installation, Operation, and Troubleshooting. Please study this manual carefully before installation, and use the printer according to these instructions. Keep this manual handy and refer to it when necessary.

1.2. Precautions

Please read this section carefully before using the printer.

1.2.1. Safety

The printer can only be used with the power adapters supplied by this company, or the product may be damaged, with a risk of fire. To avoid burning, or model deformation, do not touch the model, nozzle, or the platform by hand, or any other part of the body, while the printer is working or immediately after it has finished printing.

Protective glasses should always be worn when removing support material. There is a slight smell from filament material when it is being extruded. The smell is, however, not too unpleasant. Operate in a well ventilated room but draught free, as draught will cause warping.

1.2.2. Protection

- The printer must not be exposed to water or rain to avoid damage.
- Do not shut down the printer or pull out the USB cable when loading a digital model or the model data may be lost.
- The printer is designed to work properly at an ambient temperature of between 15°C and 30°C and humidity of between 20% and 50%. Operating outside these limits may result in low quality model.
- Please turn off the printer when SD card needs to be inserted or pulled out.
- We are not responsible for any damage caused by filament material from outside which not authorized by our company.

2. Overview

Thank you for choosing Einstart 3D Printer. It is designed with ultimate portability and simplicity in mind. The system and software allows you to print great models with only a few keystrokes, even if you have never used a 3D printer before. The system uses a nozzle to deposit molten plastic to make a solid object layer by layer, so printed parts are strong and durable.

2.1. Appearance

Figure 2.1 is the front view and side view of printer.

Figure 2.1

- | | | |
|-------------------|---------------|----------------|
| ① Framework | ② OLED Screen | ③ Platform |
| ④ Extruder Nozzle | ⑤ Tube Fan | ⑥ Spool Holder |
| ⑦ Power | ⑧ USB | ⑨ SD card |
| ⑩ Switch | | |

2.2. Axes

In the figure 2.2, the direction of arrow is the forward direction of the axes.

Figure 2.2

3. Installation

3.1. Install printer

The printer was tied up to avoid damage during transportation. Please remove these protective parts before use the printer .

Figure 3.1

- ① Rope
- ② Sponge Mat

3.1.1. Connect power adapter and USB cable

As figure 3.1.1 shown, there are USB connection and power interface on the side of the printer, please connect the printer and computer via a USB cable and connect the power adapter.

Figure 3.1.1

a: connect USB

b: connect Power adapter

3.1.2 Set Platform

As figure 3.1.2 show, placing three outstanding magnetic point into slot to set stably the printing platform.

Figure 3.1.2

3.1.3 Spread glue

First step: spread glue on the build platform.

Second step: make the glue joint the platform evenly.

Third step: ensure the glue shape is fit properly.

Fourth step: place the platform in right place.

Figure 3.1.3

3.1.4. Install filament

First step: make sure the head of filament is neat.

Second step: set up the filament through the hole inside the printer.

Third step: insert filament tube to the top hole.

Fourth step: put filament on the tray.

Figure 3.1.4.1

Figure 3.1.4.2

3.1.5 Print the model

- 1) Start up: power on, and press the  button for 3 seconds.
- 2) Menu: press the  button to choose "Fast operation".

Figure 3.1.5.1

3) Load filament: press the  button to load filament, put the filament in the hole and wait for the temperature rise.

Figure 3.1.5.2

4) Return: press the  or  button to exit when the filament is extruded from the nozzle.

Figure 3.1.5.3

Figure 3.1.5.4

5) Build: get back to the “Fast Operation” and press the “▶” button to choose model.

Figure 3.1.5.5

6) Select: press “▲” “▼” to choose model, and press “OK” to print the model you want.

Figure 3.1.5.6

7) Pause: If you wanna pause, press “◀” to exit, and press “OK” to confirm it.

Figure 3.1.5.7

Figure 3.1.5.8

8) Resume: used for change filament, see figure 3.1.5.9.

Figure 3.1.5.9

9) "Save-Shut Down": it will save the model file, you can resume printing the model after reboot the machine. "Stop": just cancel the printing.

Figure 3.1.5.10

3.2.Windows OS Software installation

3dStar supports the operating system Win7 32/64bit, Win8.1 and Mac OS X. Please refer to “Read Me file” before setting up the software. There are printing software 3dStar, driver, and STL models in the SD Card.

3.2.1. Software Installation

For install all drivers successfully, please insert SD card into your PC with USB to SD card converter. If you system is windows, find “Windows” folder, open “3dStar” folder, then click *xxx_setup.exe* file, entering the program installation interface as the picture shown below.

Figure 3.2.1.1

1. Click “next”, and select “I Agree” to continue next step.

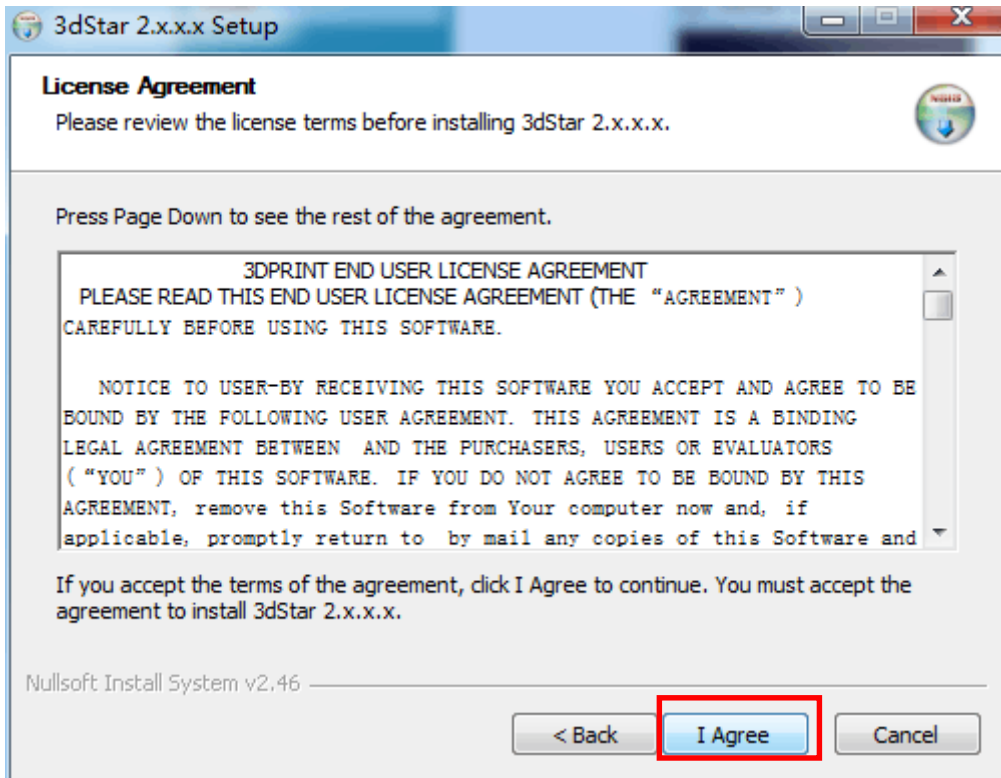

Figure 3.2.1.2

2. Select the installation directory, and Click "Install" to start the SETUP WIZARD

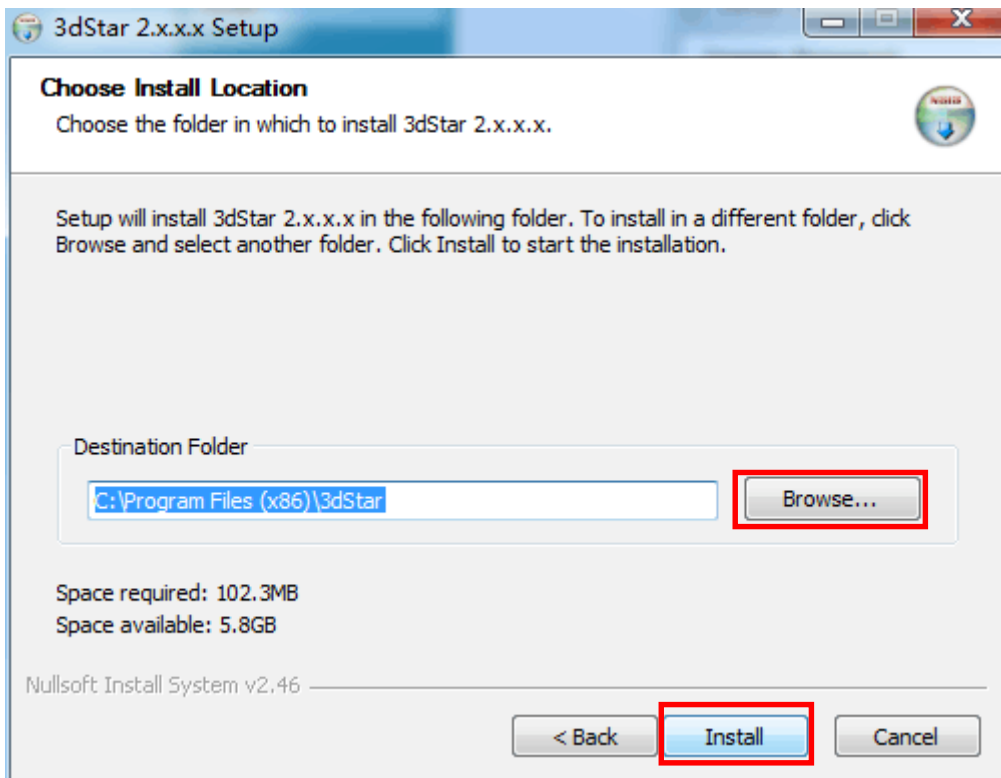

Figure 3.2.1.3

Figure 3.2.1.4

3. In a while, the following interface will appear, please select “I have read and accept the license terms”, and click “install”.

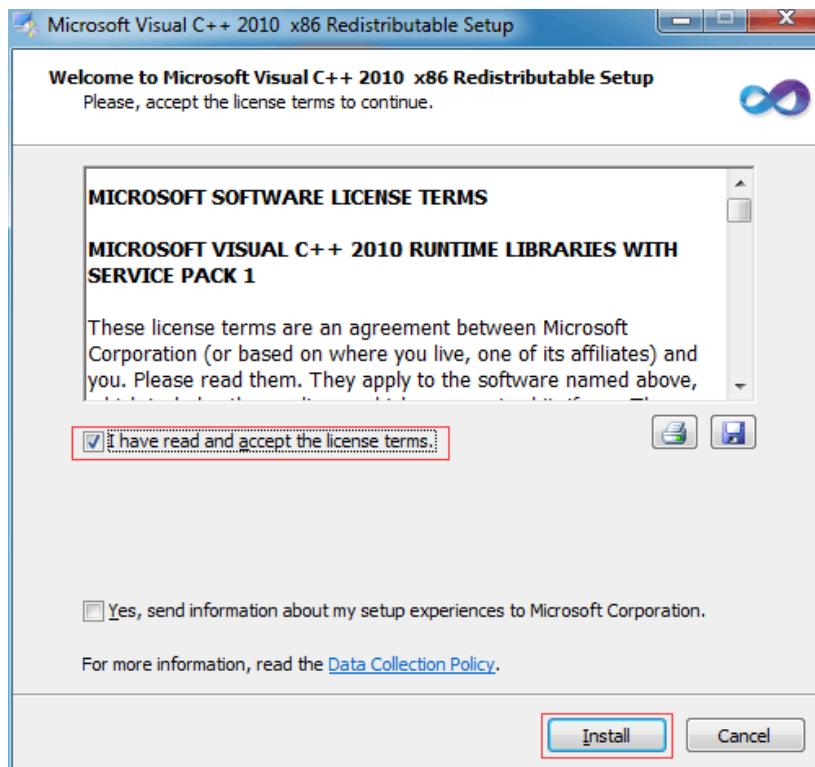

Figure 3.2.1.5

4. Click “Finish” in the pop-up dialog, and the installation is successfully

installed. .

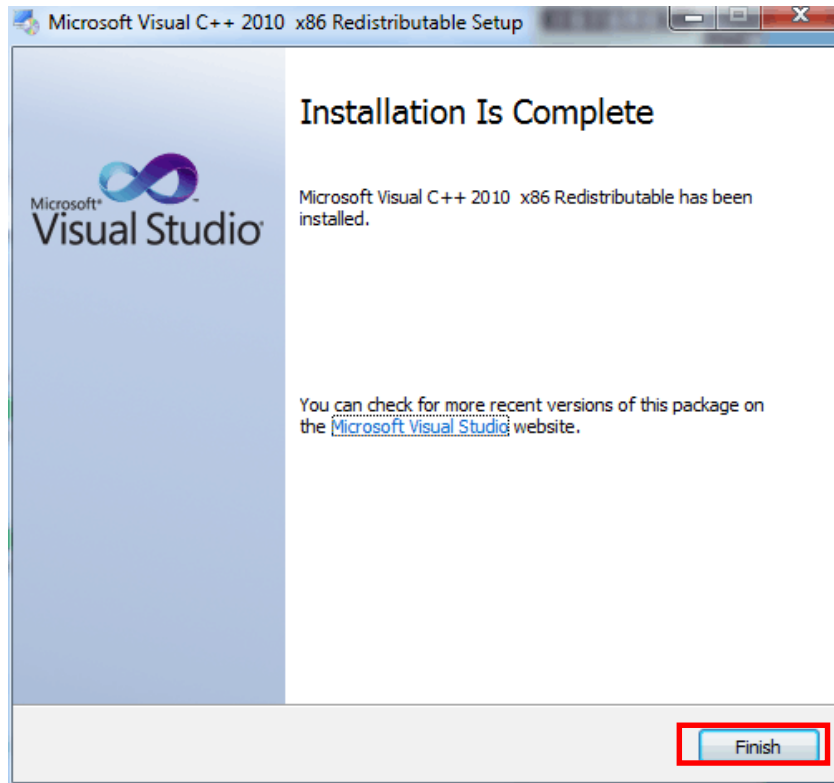

Figure 3.2.1.6

Notice: if either of the below two interface appears, it means that the latest version of Microsoft Visual C++ 2010 x86 Redistributable operation environment has been installed. Click “Cancel” to complete the installation.

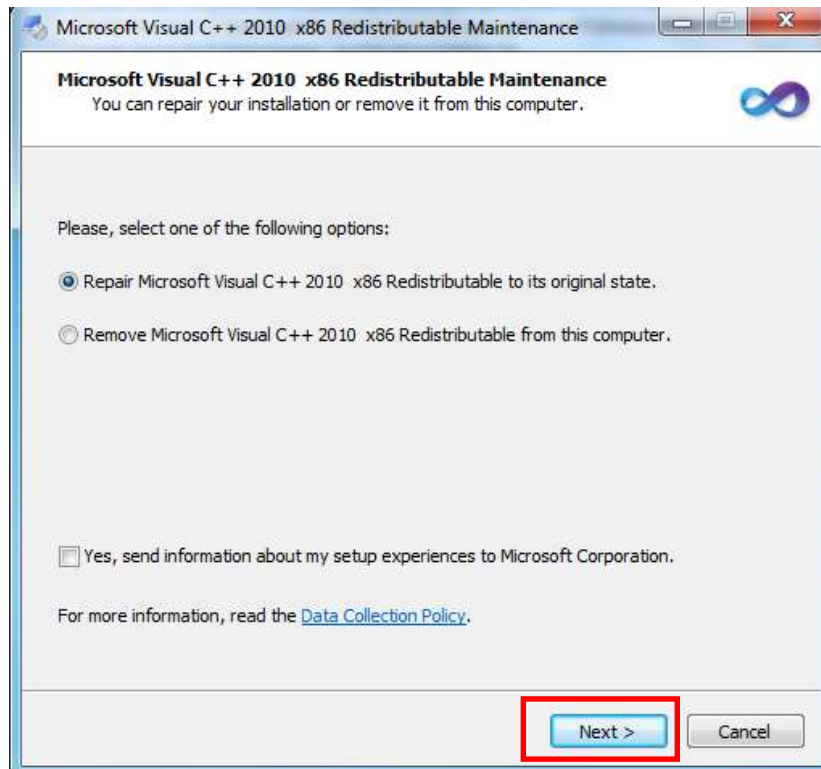

Figure 3.2.1.7

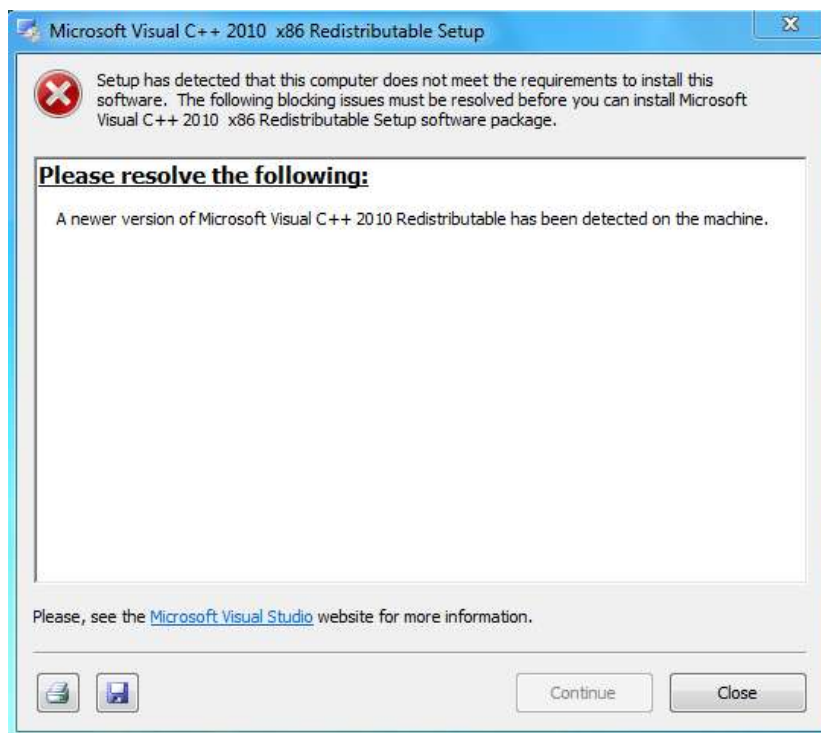

Figure 3.2.1.8

5. Install the driver of USB to serial port.

Figure 3.2.1.9

Click "Extract", do as the guide shows, see figure 3.2.1.9.

Figure 3.2.1.10

Click "finish" in the follow dialog to exit the guide, see figure 3.2.1.11.

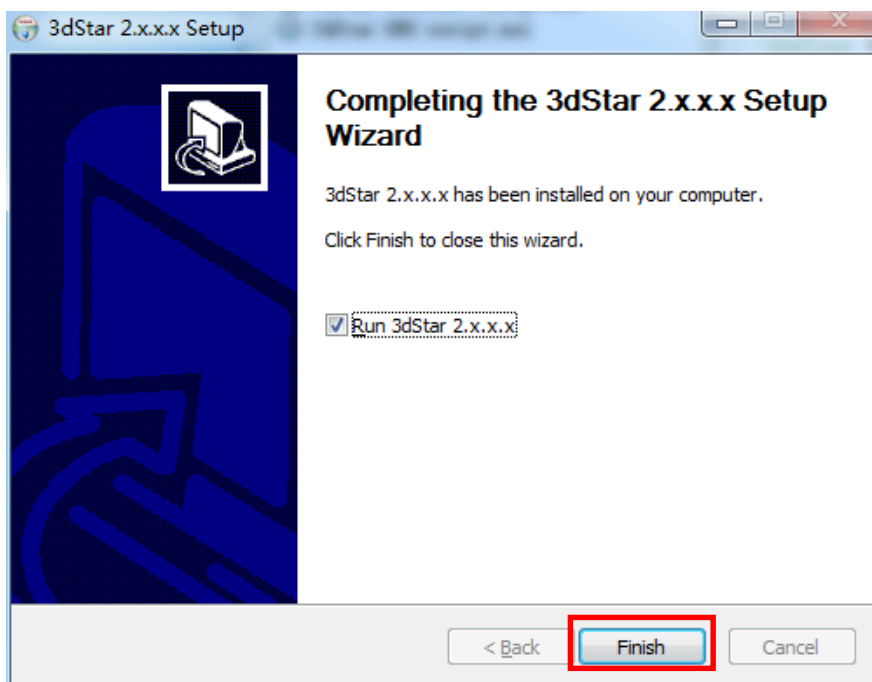

Figure 3.2.1.11

3.2.2 Program registration

Program registration has been done after software setup. If a new key should be registered, do as follows:

1. Open 3dStar folder, double-click "License Install.exe", see figure 3.2.2.1.

Figure 3.2.2.1

2. Click open, select key file(*.reg or *.lic)

Figure 3.2.2.2

3. click "install" to finish registration.

Figure 3.2.2.3

3.3. Mac OS software installation

If your system is Mac OS, choose “Mac” folder. Before setting up the software, you should refer to Read Me file.

3.3.1.Drive installation

1. Double click “3dStar.dmg”, a virtual device is showed on desktop, see figure 3.3.1.1.

Figure 3.3.1.1

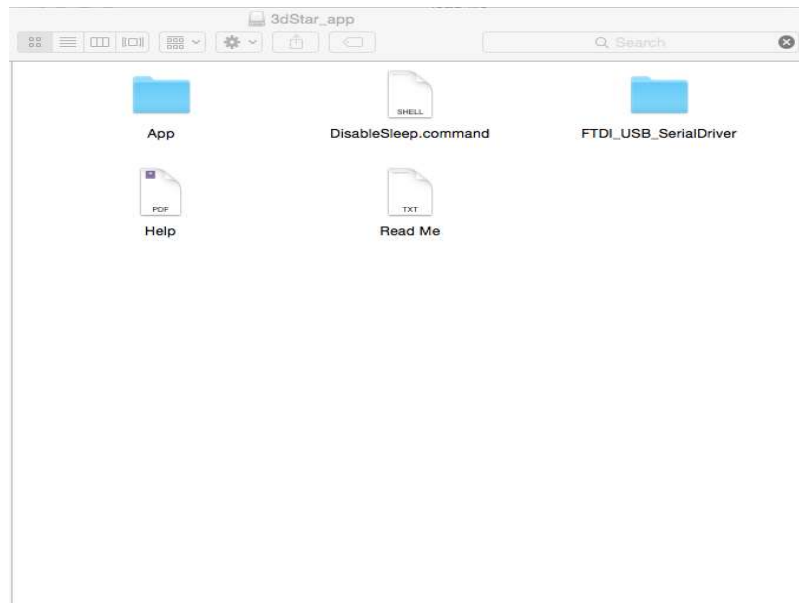

Figure 3.3.1.2

2. Double click “FTDI_USB_Serial Driver”, double click the file, see figure 3.3.1.3.

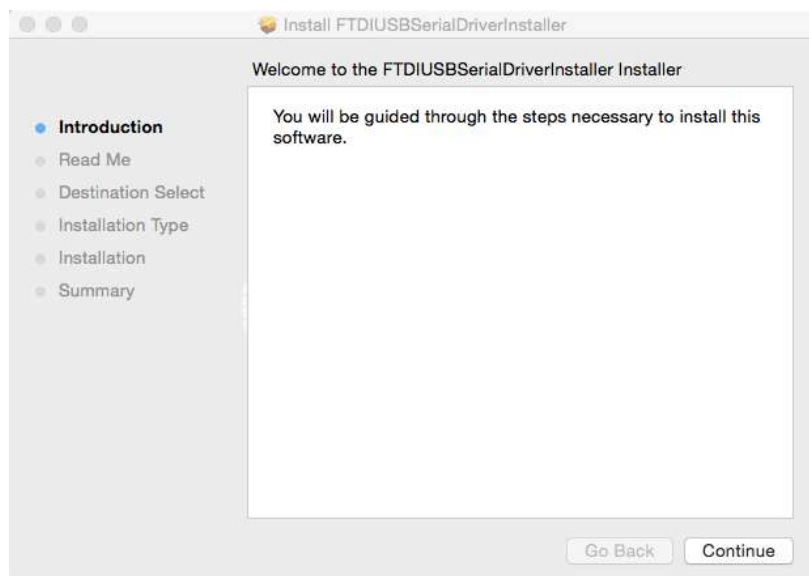

Figure 3.3.1.3

3. Input user name and password, see figures as follows.

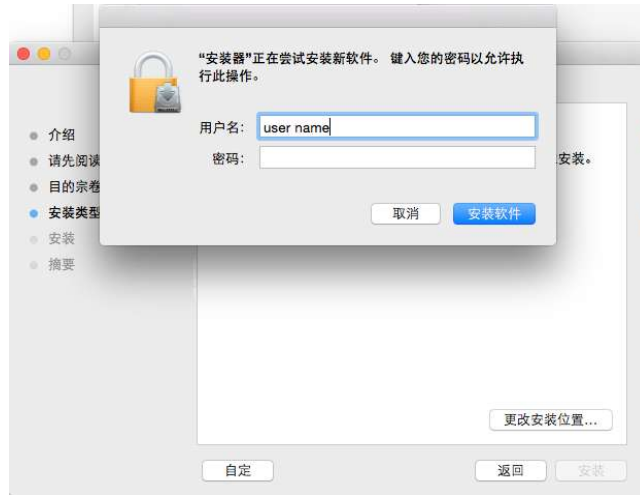

Figure 3.3.1.4

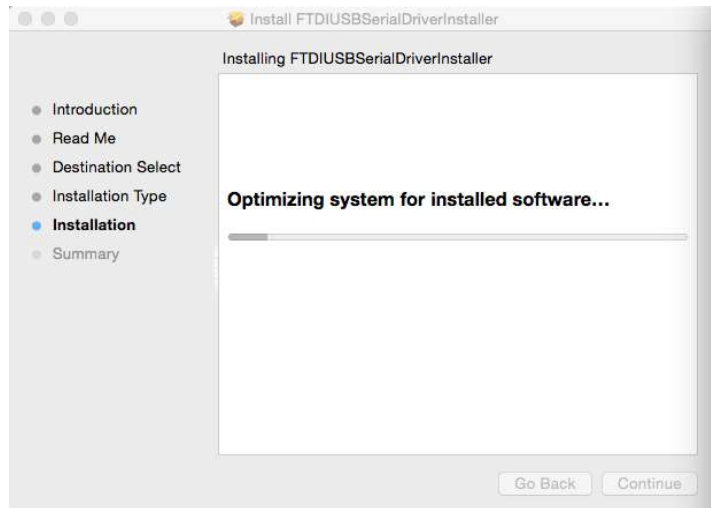

Figure 3.3.1.5

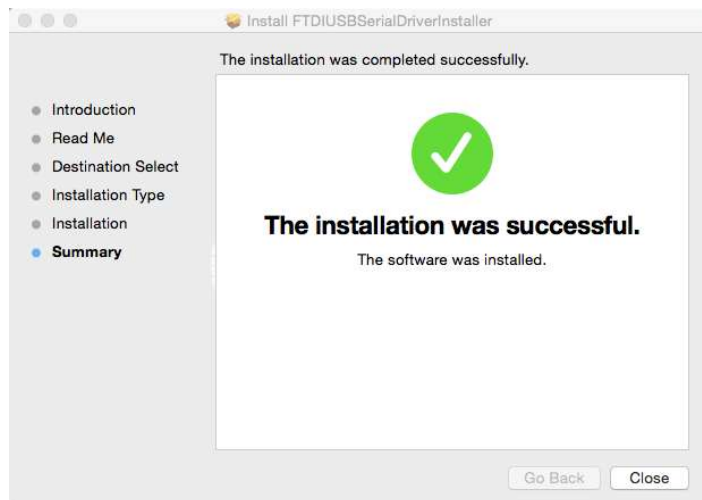

Figure 3.3.1.6

4. Double click script “Disable Sleep.command”.

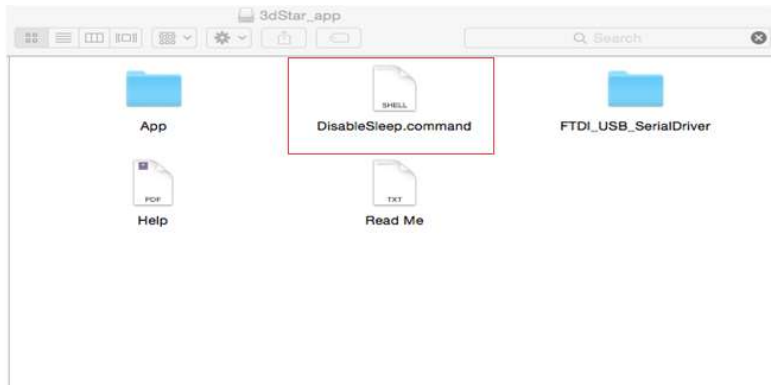

Figure 3.3.1.7

3.3.2. Program registration

1. Go to folder “App”, double click “License Install”.

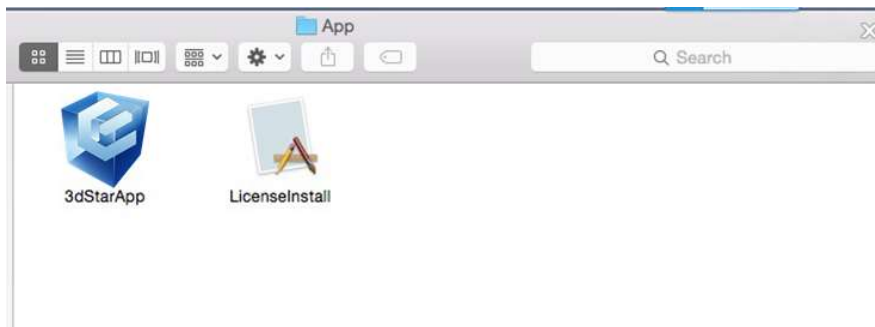

Figure 3.3.2.1

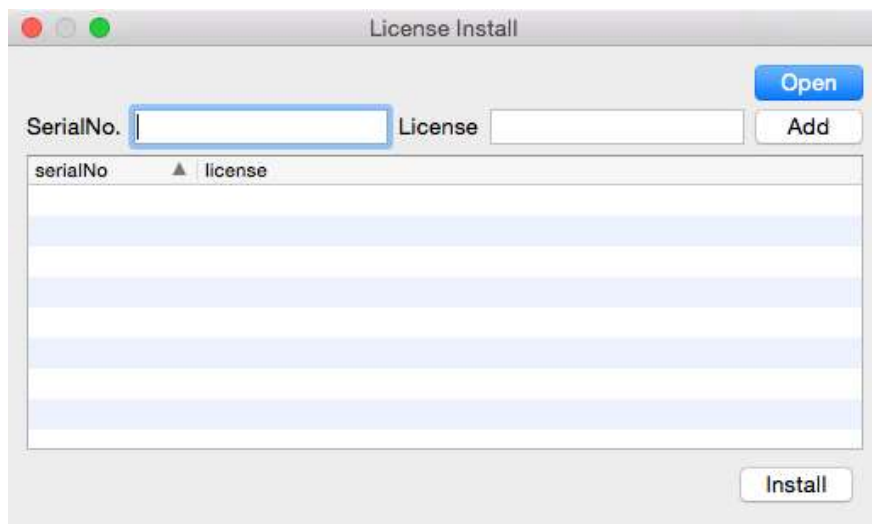

Figure 3.3.2.2

2. Click open, go to folder “SD”->”Mac”, select key file(*.reg or *.lic), install.

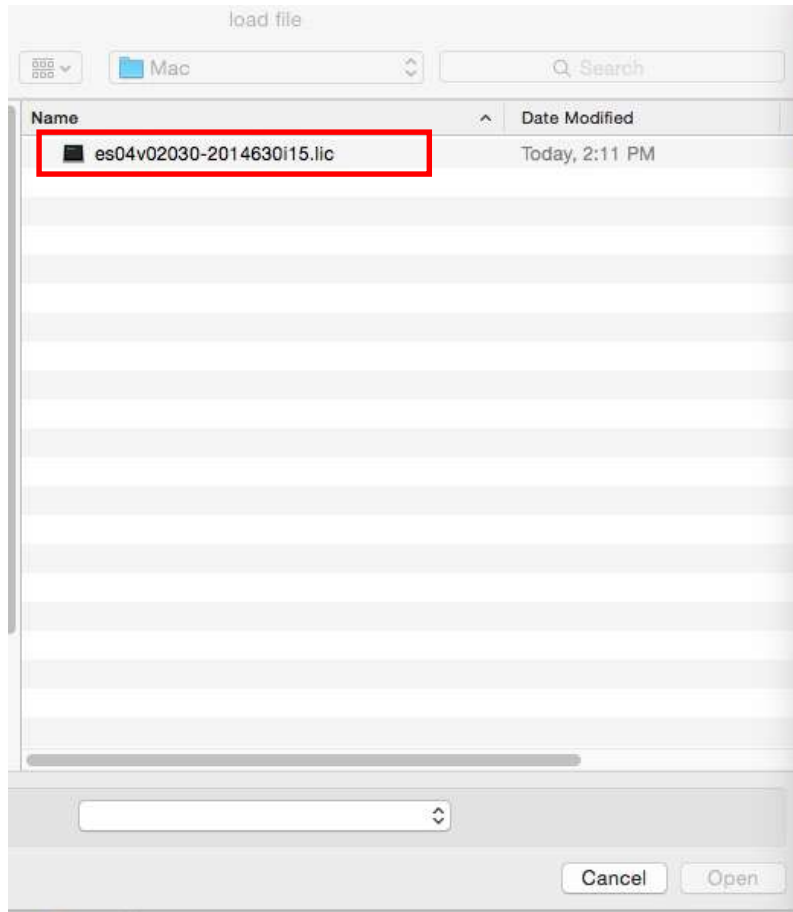

Figure 3.3.2.3

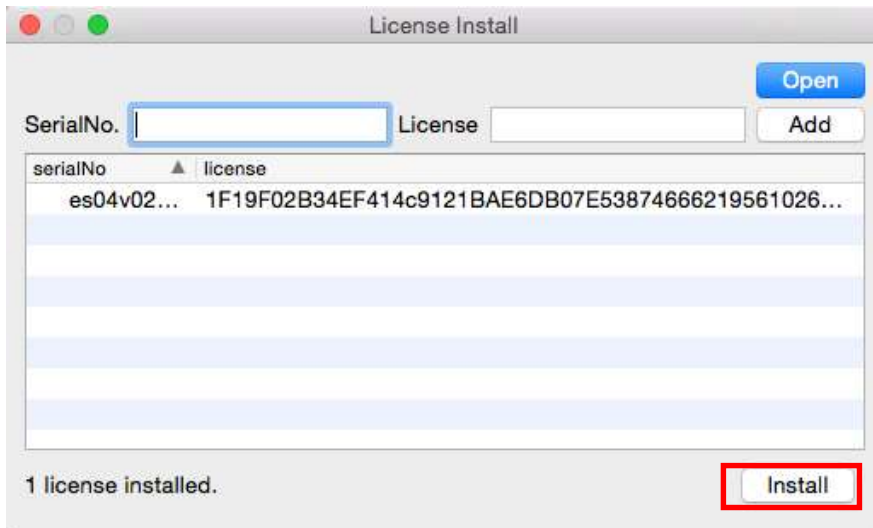

Figure 3.3.2.4

4. Print Steps

1. Connect USB and power cable, and power on the printer.
2. Install the driver and print software according to the wizard, see [software setup](#). (Only need to do once if connect the printer to the same computer.)
3. Open the printer software 3dStar.exe if your system is Windows ,or 3dStarApp if your system is Mac OS.
4. Waiting for auto-connection. If status button is gray, choose serial device which is found from menu “Tools”->”select machine”, see figure 4.1and 4.2 for Windows or figure 4.3 for Mac OS for serial choose.

Figure 4.1

Figure 4.2

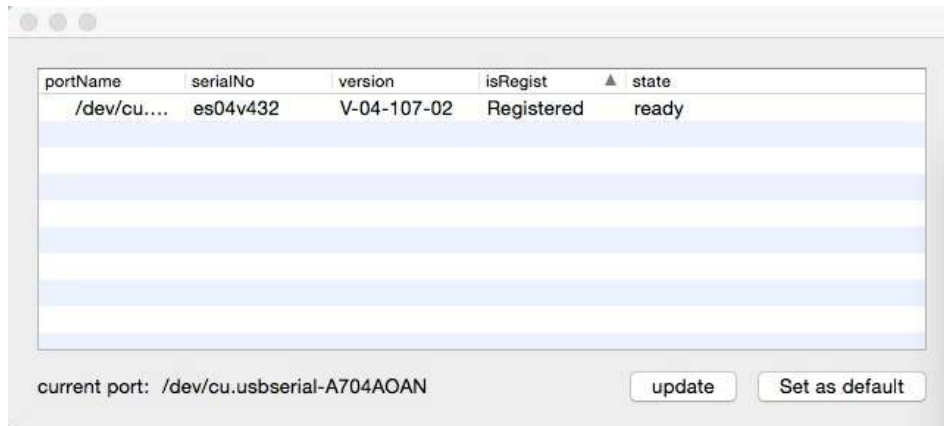

Figure 4.3

5. Check the platform level is horizontal or not. Refer to 7.4 for detail; Make sure the nozzle is clean before printing.

6. Open models

Figure 4.4

7. Make generating path, see figure 4.5. You can change the parameter by clicking

“”, see figure 4.7.

Figure 4.5

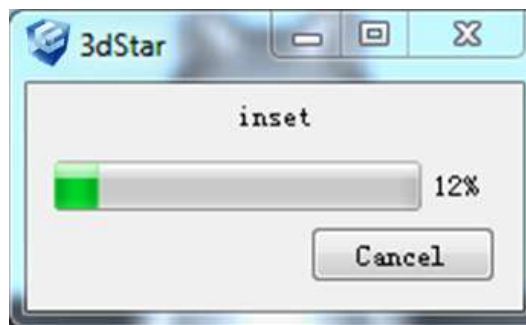

Figure 4.6

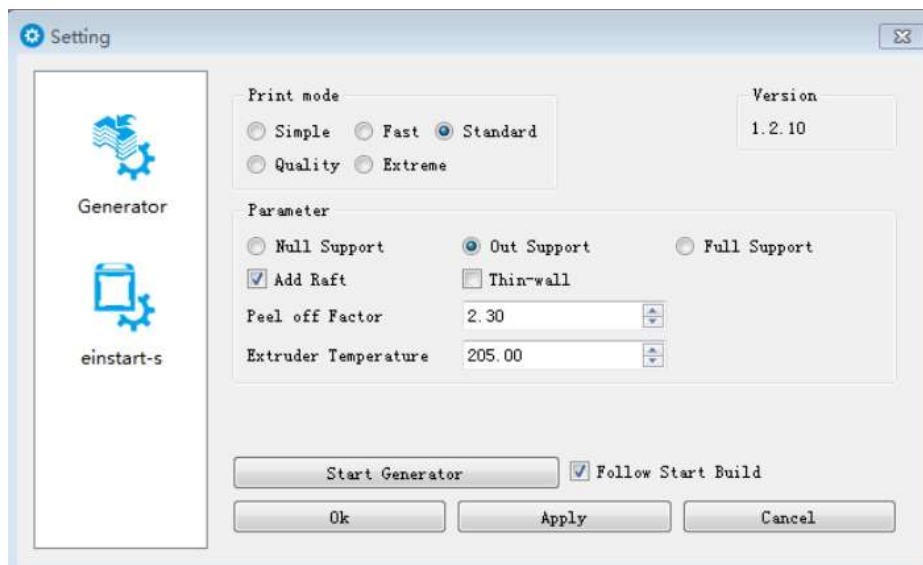

Figure 4.7

Note: If the model had been generated Path, when it generate Path again, it will cover the last generated Path.

8. After Generating and loading Path are finished, click  to start to print.

: Stop printing

: Pause printing

: You can see the build status, see figure 4.8.

Figure 4.9 shows the model printed.

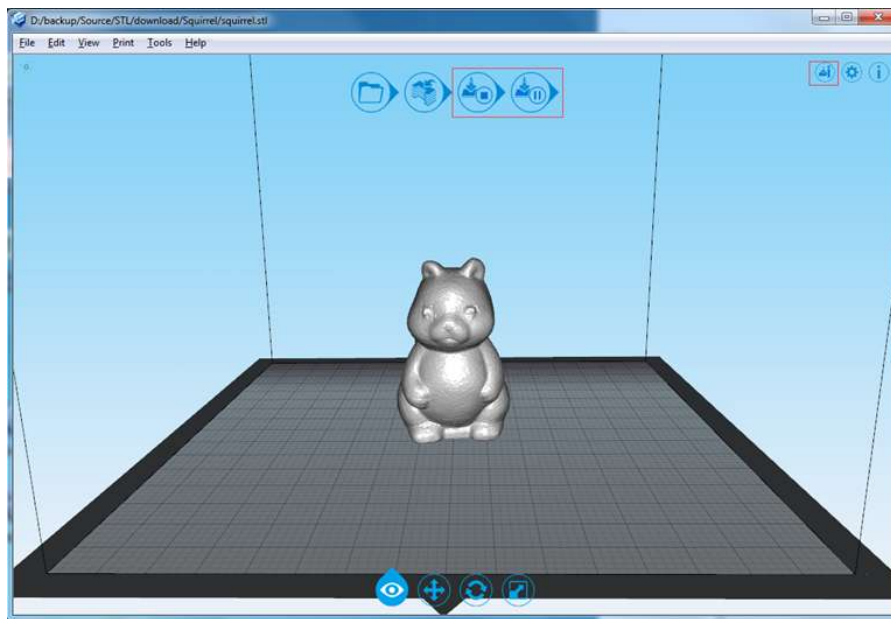

Figure 4.8

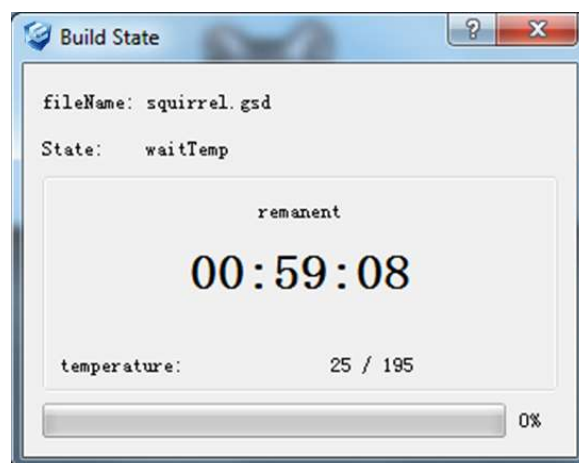

Figure 4.9

Figure 4.10

5. The Basic Functions of Software

Open the program “3dStar.exe”, the software window show as figure 5. Some basic functions are as the follows:

①Menu ②Short cut guide area ③Setting and status area ④ Edit area

Figure 5

5.1. Menu

All functions can be found in menu.

Figure 5.1

5.2. Short guide area

This area contains three button for opening files, path generation and start/stop printing. It's easy to get to print a model.

5.3. Setting and status area

It contains path generation module, device info and control module. You can also see printing status and software info.

5.4. Edit area

It contains model view, move, rotate and scale function. The model should be

selected before any edit action. You can click  to go back to the origin model.

- : View.

- “”: Move.

- “”: Move the model to the center.

- “”: Rotate.

- “”: The model will be rotated automatically according to the surface clicked by the mouse.

- “”: Scale.

- “”: Enlarge the model to the max print size.

6. Print setting references

6.1. Path generator setting

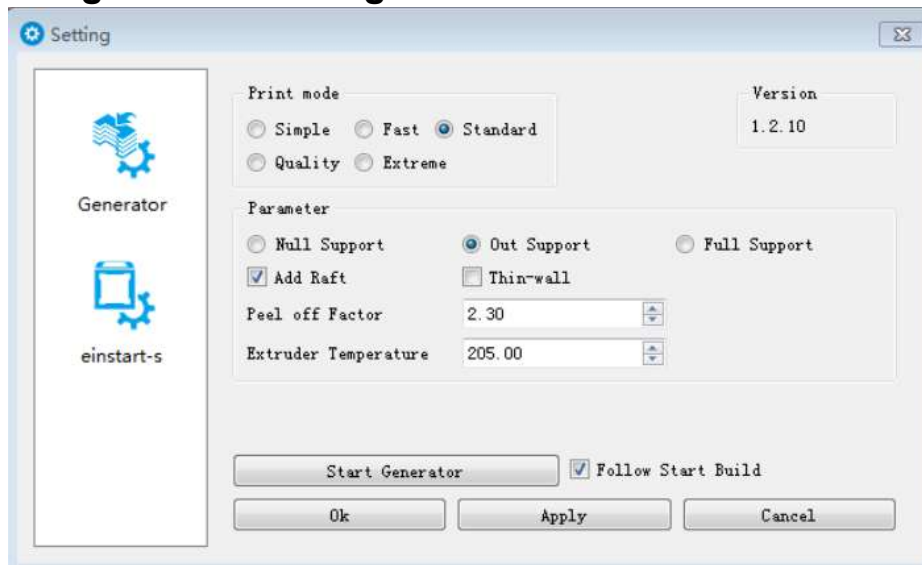

Figure 6.1

Usually, only “Print mode” needs to be adjusted. It is best to use the defaulted setting to print, or the extruder might be blocked.

There are 5 options to set the print accuracy between 0.1mm to 0.4mm per layer. The finer the layer, the better the quality, the stronger the printed part and the longer it takes to print.

MODE_Simple:0.4mm layer thickness;

MODE_Fast:0.3mm layer thickness;

MODE_standard:0.2mm layer thickness;

MODE-Quality:0.15mm layer thickness;

MODE-Extreme:0.1mm layer thickness;

Support Mode:

None support:There is no support generated.

Outside support:The support will be generated outside on the raft

Full support:There will be outside and internal support generated.

Add raft

Select "add raft" will generate a model base which helps to printing stability.

Peel off Factor 2.30

"Peel off Factor" reflects the height between model and raft. If the layer thickness is 0.2mm and the strip rate is 2.3, which means the height between model and raft is 0.46mm. So lower number means the more tighten that model stick to raft.

Thin-wall

Select "Thin-wall" means only external shell except top surface will be created without any internal support.

Extruder Temperature 200.00

Set the nozzle heating temperature.

Follow Start Build

Select "Follow Start Build" to start printing automatically after generating Path file.

Path view

Path view: You may view the path of model if you click 'Tools'-'Path Viewer'.

6.2. Extruder control

Click menu ->"Tools"->"Manager for material", choose "Material In", then click "next", see figure 6.2.1.

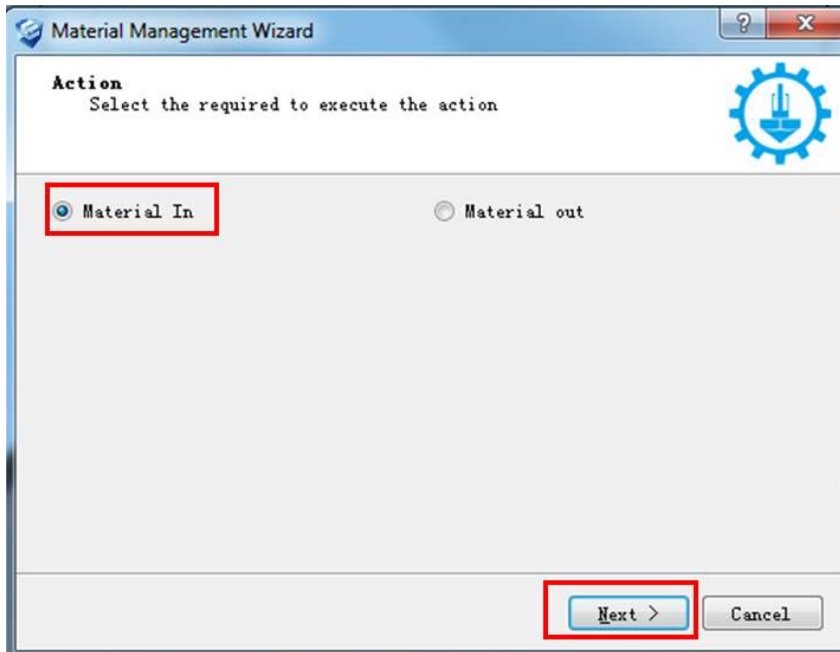

Figure 6.2.1

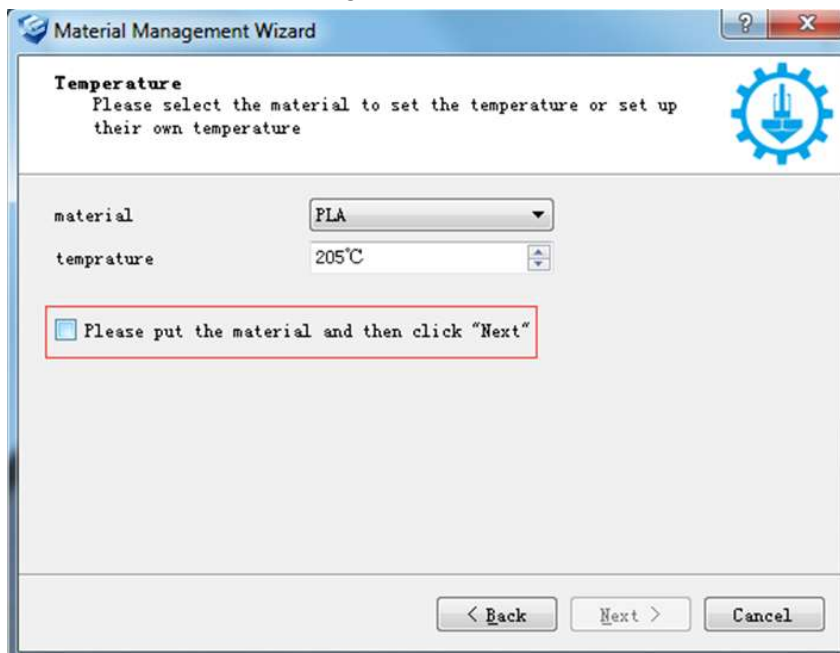

Figure 6.2.2

When the temperature up to the preset number, the printer will load filament automatically.

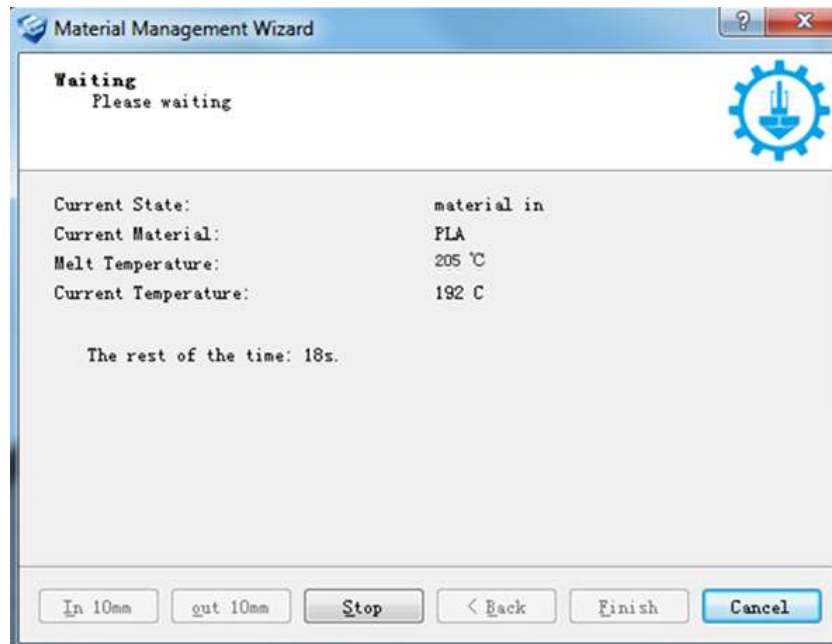

Figure 6.2.3

6.3. Pause/restart printing

Figure 6.3.1

Click PAUSE, the platform will move to a secure position, and extruder control dialog will pop up. You can operate on Material-IN, Material-Out or Material-Change. Figure 6.3.2 shows the colorful model.

Figure 6.3.2

6.4. Set Z axis Height

Notice: this function can be only operated when the printer is online.

1. Click , then choose machine "einstart-s".

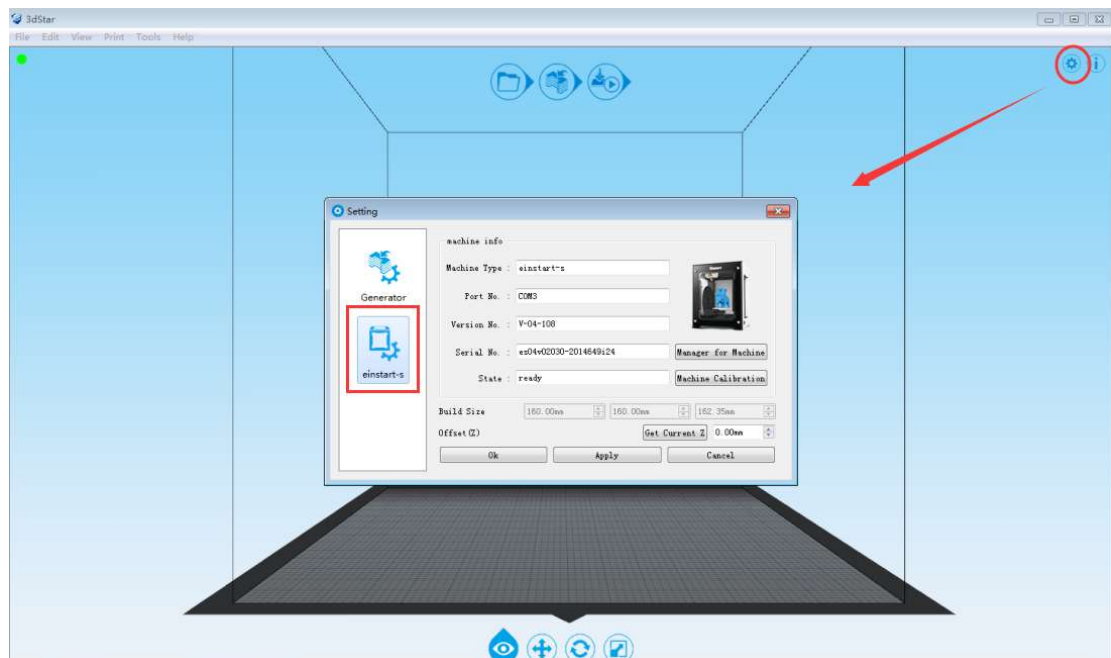

Figure 6.4.1

2. Click "Machine Calibration", see figure 6.4.2.

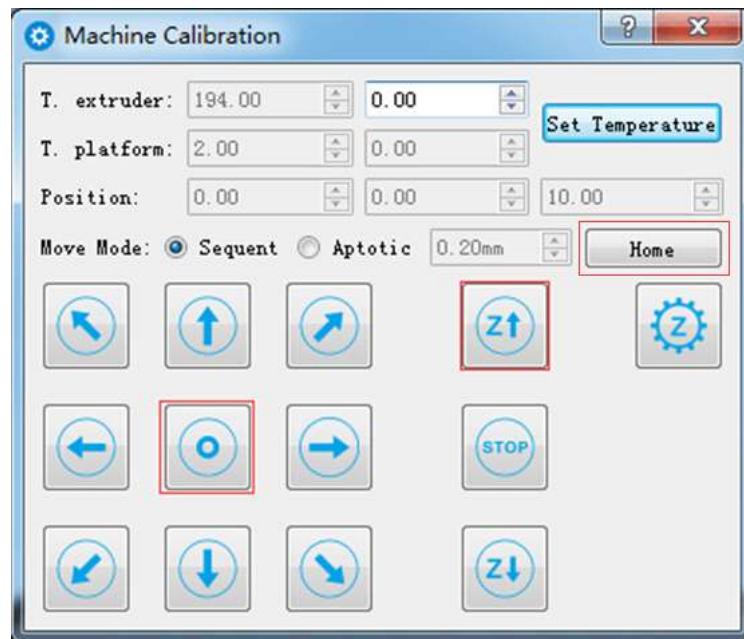

Figure 6.4.2

3. Click “Home” to move z axis to home position.

4. Click “” to move the extrude nozzle to the platform center.

5. Click“” to lift the platform until it close to the nozzle. Move mode can be chose either Sequent or Aptotic. Please input a proper number in entry field when use Aptotic, avoiding the number too large to hit the platform. This step should be operated carefully. See figure 6.4.3

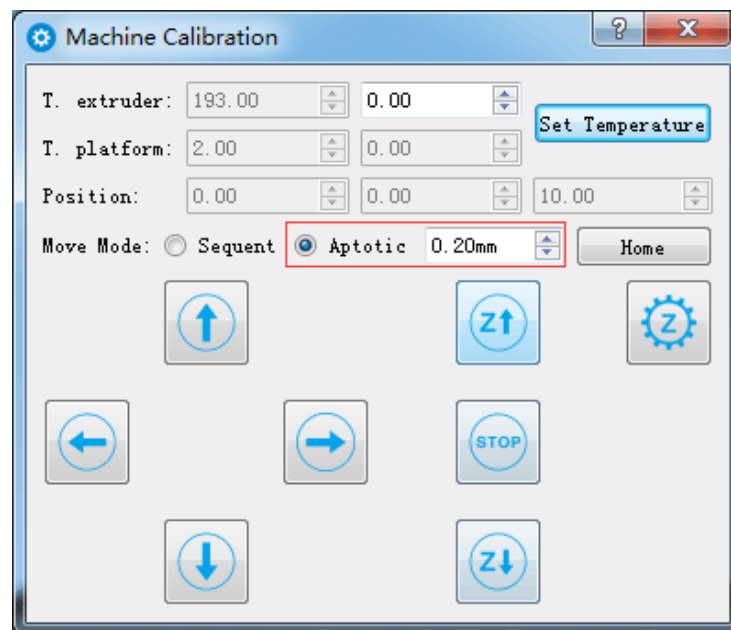

Figure 6.4.3

6. When the distance between the nozzle and platform adjust properly (about 0.2mm),

click “” to set the offset, see figure 6.4.4. You can also go back to “setting” to get the offset and apply, see figure 6.4.5. Make a note that the value may be negative.

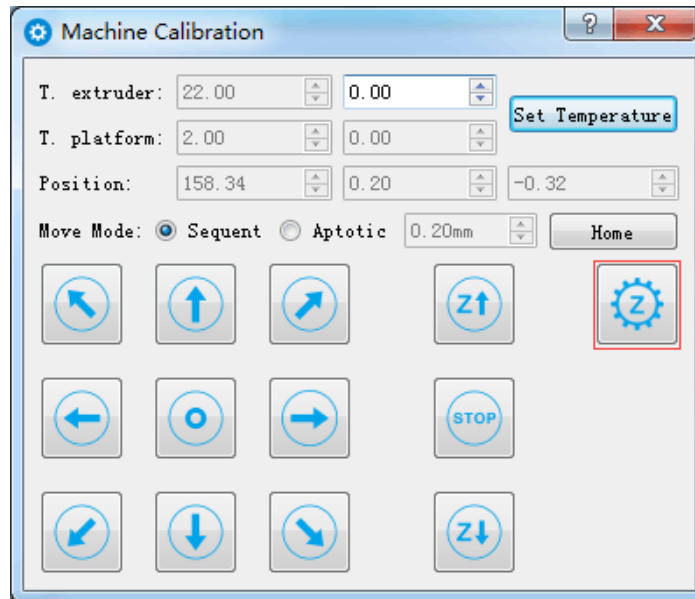

Figure 6.4.4

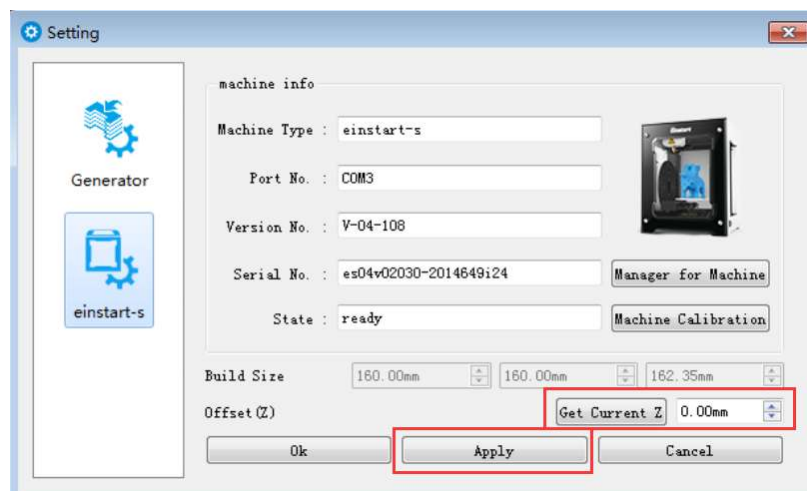

Figure 6.4.5

TIP : You may need to set Z height when models are not adhering to the platform properly or are distorted.

6.5. Level platform

Before the operation, you should know the ways to fix the print platform and adjust the distance between platform and nozzle well. Figure 6.5.1 shows the platform set.

Figure 6.5.1

① Using 3 screws and 3 pressure springs to fix the print platform. Shown as the figure 6.5.2.

Figure 6.5.2

② The platform will move down if tighten the screws; The platform will move up when loosen the screws. Shown as Figure 6.5.3.

Figure 6.5.3

③ Set the nozzle temperature and platform temperature in the “Tools”->”Manager Calibration”, then click “Set Temperature” to start heating. Set the nozzle temperature as 180.0~200.0°C (PLA) . If there is material on the print head, please clean it at first.

Figure 6.5.4

④ Please set the temperature to be “0” after cleaning the nozzle, and make sure the rest filament does not affect on adjusting leveling.

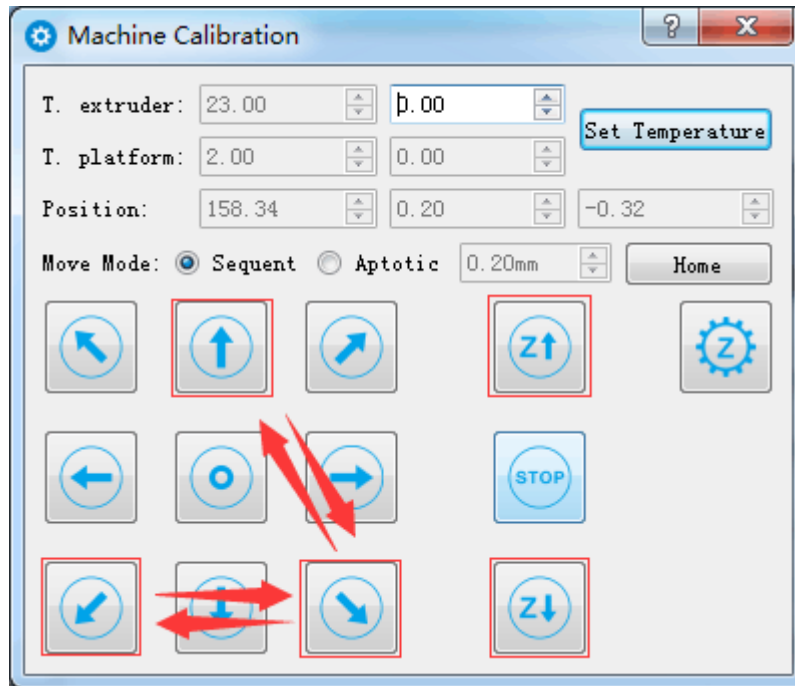

Figure 6.5.5

⑤ Click  from “platform Leveling” dialog box, and move the platform to the corner (“bottom left” corner) which corresponds to screw “(a)”

⑥ Click  from “platform Leveling” dialog box to rise the platform to highest point. If platform is near nozzle, please adjust a little from “Control Panel”. If the platform is far from nozzle, don’t need to adjust, you can set the Z axis height after the platform leveling.

⑦ Click  from “platform Leveling” dialog box and move the platform to the corner (“bottom right” corner) which corresponds to screw “(b)”. Then compare the height of “bottom left” corner (the height between nozzle and worktable, similarly hereinafter), and adjust screw “(b)” to make sure the height is the same as “bottom left corner”.

Click  and  to check the height difference and adjust to the same height as nozzle. Don’t move this two screws any more after operation finished.

⑧ Click  from “platform Leveling” dialog box and move the platform to the “center of Y axis” position and check the height to adjust screw “(c)” to make sure the

height is the same as we did in last step. Click  and  to check the height difference and adjust screw “(c)” to the same height as nozzle height(during the adjusting, maybe there is some space between worktable and nozzle, and it can be

adjusted a little the height of worktable and nozzle using “Control Panel”).

- ⑨ Click “” to check the platform is level or not. If not, please do from step 3.

6.6.Firmware Update

1. Click “Tools”->”Firmware Update”, see figure 6.6.1.

Figure 6.6.1

2. Select serial device, see figure 6.6.2 for Windows and figure 6.6.3 for Mac.

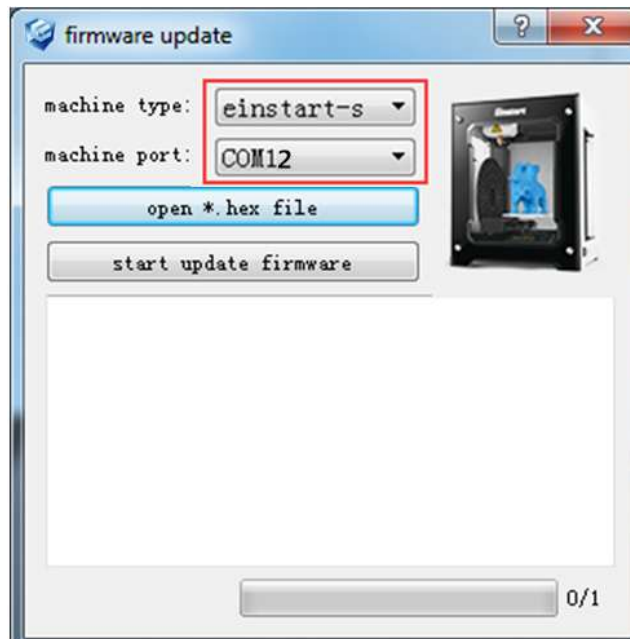

Figure 6.6.2

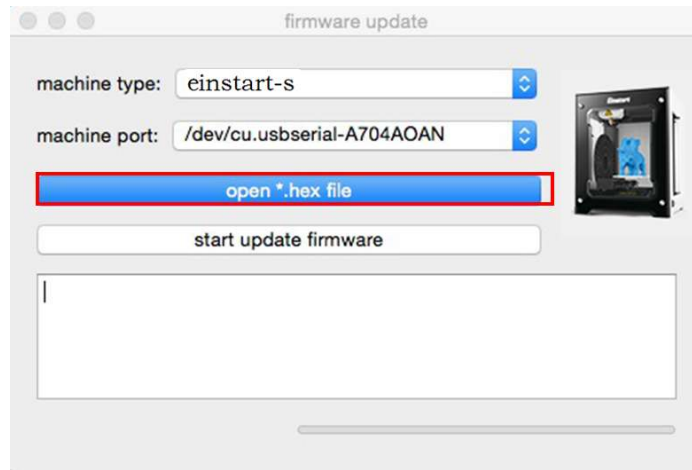

Figure 6.6.3

3. Click “open *.hex file”, choose hex file.

Figure 6.6.4

4. Click “start update firmware”, follow the guide to finish.

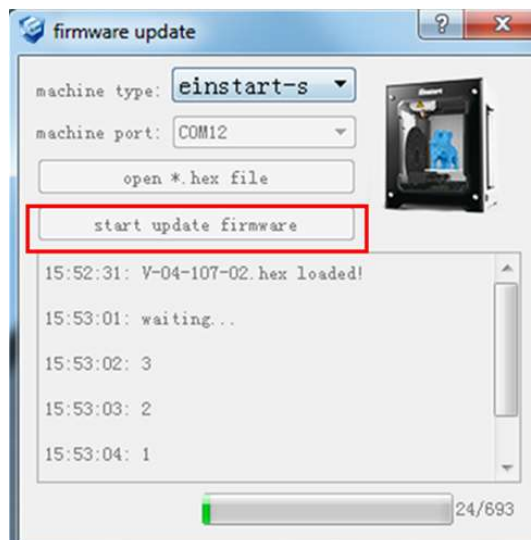

Figure 6.6.5

7. Maintenance

7.1. Changing the Material

Loading, withdraw and change the filament by “Tools”->”Manager for Material”

Note: the nozzle and print head is quite hot, so please wear the gloves during the operation.

7.2. Cleaning the Nozzle

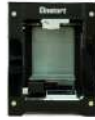

After being used for several times, the nozzle will be covered with a layer of oxide material. When printing, the oxide filament may be melted and fall, and cause the model surface to change the color, so you need to clean the nozzle regularly.

At first, preheat the nozzle and set the temperature as 240°C (ABS) , 195°C(PLA), then wait it heat up. Then use the heat-stable material such as pure cotton cloth or wadding to clean the nozzle.

7.3. Accessories

You can print the all plastic accessories of the printer by yourself. Because there are some 3D model in the file “3DModel”, containing tray holder, tube mounting bracket, Extruder guard and so on. If these parts are damaged, you can print them by yourself.

7.4. Packing list

| | | |
|--|---------|---|
| 3D printer mainframe | 1 set |  |
| Power supply and cable (out24V/3.75A) | 1 piece |  |
| USB cable | 1 piece |  |
| Filament tube | 1 piece |  |
| Filament | 1 spool |  |
| Hex wrench | 1 set |  |
| Cutter | 1 piece |  |
| Spatula | 1 piece |  |
| Tweezer | 1 piece |  |

| | | |
|----------------|----------|---|
| Pen knives | 1 piece |  |
| SD card | 1 piece |  |
| SD card reader | 1 piece |  |
| Glue | 1 bottle |  |

7.5. Specification

| | |
|----------------------|-------------------------------|
| Print Envelope | 160*160*160mm |
| Layer thickness | 0.1, 0.15, 0.2, 0.3, 0.4mm |
| Nozzle diameter | 0.4mm |
| Move speed | 60mm/s |
| Vertical print speed | about 30cm ³ /hour |
| Positional accuracy | ±0.1mm |
| Consumable Materials | PLA |
| Connectivity | USB, SD card |
| Nozzle | 1 |

8 FAQ

8.1. The filament is blocked

Phenomenon: Make a sound when printing or load filament.

Solution: At first, unload filament and shear it evenly .If do this can't solve the problem. (Refer to the video or document instruction named“Deal with the blocked filament”.)

Reason: Poor quality filament, or forget change filament before it exhausted.

8.2. The platform is not plain

Phenomenon: (1)The first layer of model raft is not plain.

(2) The platform base is not plain. There are friction and white powder on Y axis which is caused by the friction between inclined platform and Y axis

Solution: Use “3dStar” software to adjust platform and reset the height of Z axis. (Refer to user manual page 50-52).

Reason: Long time use may cause the screws on platform base to loosen. It is better to adjust the platform in every 2-3 weeks.

8.3. Model can't adhere to platform.

Phenomenon: The model edge warps or totally falls out of the platform.

Solution: Put glue evenly on the platform, reduce strip rate or raise nozzle temperature when generating print path.

Strip rate range from 1.8 to 2.6, lower rate number be set, more tight become.

Nozzle temperature range from 195°C to 230°C, higher temperature, more tight become.

Reason: (1) New platform is too smooth to adhere the model;

(2) The model is too big;

(3) It is also relevant with the shrink rate of filament.

8.4. Nozzle is surrounded by filament

Phenomenon: The filament is clumped up around the nozzle

Solution: Take off the extruder cover and press the button of load filament to heat the printer head. Remove the cooling protective cover when the filament is softened. At last, clean filament by tweezers (Please refer to the video or document instruction named “Clean nozzle”.)

Reason: The filament is not adhered on the model, but turned around the nozzle.

8.5. 3dStar software can't connect to 3D printer or control it.

Phenomenon: It can't find serial NO. in 3dStar software.

Solution: Re-install the driver of printer and register the serial NO.

Reason: (1) The driver path didn't install correctly.

(2) Forget to register serial NO.

8.6. 3D printer can't read the data in SD card.

Phenomenon: The 3d printer screen show “ no SD card”.

Solution: (1) Use English and Arabic numerals name the .gsd file.

(2) Pull out or plug in SD card when the printer power off.

Reason: (1) Einstall DP 3D printer can't read the .gsd file named by Chinese word, and it only show 6 characters add number if the name above 8 characters.

(2) Pull out or plug in SD card when the power on will cause the 3d printer can't identify the SD card.

8.7. The extruder is blocked or forming cottony filament during printing the model, or the model is dislocated.

Solution: (1) Clean the filament and check whether the nozzle is blocked.

(2) load filament again.

(3) shut down the printer and check whether the X axis and Y axis can move normally.

(4) Print model again to determine the exact problem.

Reason: (1) the poor quality filament will cause the extruder blocked.

(2) The nozzle run into the model cause the printing dislocated.

(3) The nozzle is blocked.

(4) The temperature sensor is broken.

(5) The cooling fan can't move.

8.8. Limit switch broken

Phenomenon: it starts to make loudknocking noise after open the printer for some springs on limit switch is broken.

Solution: Change limit switch (Refer to the video and document).

Reason: The limit switch was broken by mistake when clean the remaining filament or damaged during transport.

8.9. The wire of power is poor connect

Phenomenon: The light of power adapter isn't work after applied power, or the power is shut down for the plug is touched lightly.

Solution: Try to update firmware again or change power adapter(24V/80W).

Reason: Update firmware failure, or the wire of power is poor connect.
